

In the Customer table, the customer has a Primary Key that connects to its corresponding Foreign Key in the Ticket Table. In this relationship, there can only be one customer, but multiple tickets. I believe that in order for the customer to become a user, they have to have bought at least one ticket.

In the Movie table, the movie_id also is a Primary Key that corresponds to its foreign key in the Ticket Table. There can only be one movie for each ticket, but there can be anywhere from zero to many tickets for each movie.
